Inside the struggle to control employees' AI use

The rise of Shadow AI pits corporate security against workplace reality.

Cybersecurity is the tech industry's longest-running game of cat-and-mouse: when new threats to data security arise, new controls are put into place to stop them, which in turn leads to the appearance of more sophisticated security threats, and so on. As organizations continue to adopt the use of AI, that classic push-and-pull security struggle has resurfaced again.

"Shadow AI" is the emerging term for the idea that employees are prone to defaulting to whatever AI tools are the most accessible and convenient (even at the expense of security or privacy). The use of these tools often stems from a desire to get more work done more quickly, but as you can imagine, that could lead to some data security issues.
